

Emergency Warning Satellite Service in Galileo

Eric Guyader, European Commission, Galileo and EGNOS programme

ICG 17 • Madrid, October 2023

Eric.Guyader@ec.europa.eu

- 28 satellites in orbit
- Remarkable performance
- Operational services, or in roll-out phase
- Strong link with users, market and industry
- Modernization on-going

Now, Then, & Next

Open Service (OS)

- Free and Open Positioning Navigation & Timing (3 frequencies + improvements)
- **Emergency Warning Satellite Service** + Advanced timing + SSV

Public Regulated Service (PRS)

- Encrypted, more robust, unlimited & uninterrupted access
- PRS evolutions

Search and Rescue (SAR) - contribution

- Forward link + acknowledgement "return link" + RBA + TWC + DPS

High Accuracy and Authentication

- High accuracy services + OSNMA
- Advanced signal authentication services

Safety-of-Life (SoL) - contribution

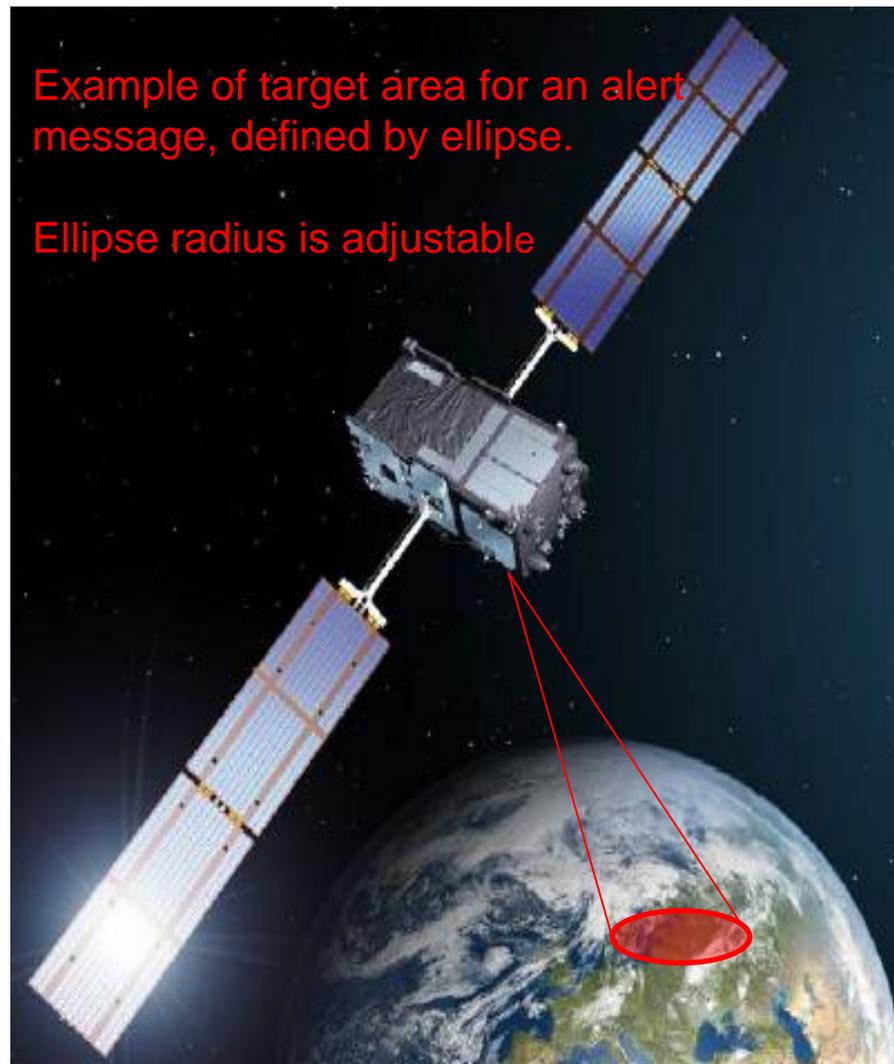

- Multilateral Workplan for aviation adoption (ARAIM+EGNOSv3)

- **Global trend to develop Disaster Risk Reduction technologies:**
 - United Nations' Sendai Framework for Disaster Risk Reduction: *“Substantially increase the availability of and access to **multi-hazard early warning systems** and disaster risk information and assessments to people by 2030”*
- **Galileo contribution to this target:** Emergency Warning Satellite Service (EWSS)
- **Use the GNSS satellite capacity for alert dissemination**
 - Purpose: **Alerting the population** in case of a looming disaster (fire, storm, floods, tsunamis, volcano, industrial...)
 - **National** Civil Protection entities **decide** to trigger the alert **and request** Galileo to broadcast a message.
 - People receive the alert message on their **mobile phone/nav' device, or public signage** displays the alert message (buildings, billboard, etc)

SERVICE CONCEPT (1)

- Dissemination of an alert message, including associated instructions to follow
- Global coverage
- Target area from local to continental scale
- Time to disseminate ~ minutes
- Available even when terrestrial communication networks are not working
- Available with standard personal devices (smartphone, car navigator, handheld...)
- Free of charge
- Alert message is authenticated
- **Complementary alert system to those already operated at national level**
 - **‘the more systems, the better’**

DOUBLE notification rule: receiver is located (1) **within the country** that emits the alert **AND** (2) **within the ellipse** encoded in the message

SERVICE CONCEPT (2)

OPERATION CONCEPT

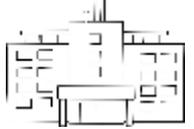

National Emergency Centre

DECISION

Galileo Emergency Service Interface

EWS Message
Bit level

Civil protection

Galileo Ground Segment

Population

(smartphone, car navigator, Handheld, smartwatch, public display, sirens, etc)

The service is realised by three components:

Civil Protection Authorities

Galileo infrastructure

end users

FORMAT OF THE ALERT MESSAGE (1)

Message Type 2 bits	Issuing entity 14 bits	Hazard type 7 bits	Hazard Characteristics 19 bits	Type of Instr. Library + version 4 bits	Instruction library 10 bits	Target area 49 bits	Specific settings 17 bits
------------------------	---------------------------	-----------------------	-----------------------------------	---	--------------------------------	------------------------	------------------------------

← Data fields 122 bits →

Common EWSS Message format

- Message Type: Alert/Update/Test/Cancel
- Country ID: ID of the country from which the alert is issued.
- Provider ID: National agency raising the alert
- Event Category: Tsunami, Forest Fire, pandemic, volcano, storm, etc
- Severity: moderate/severe/extreme (or 'unknown')
- Event Onset: Day/Hour/Minute, 7-to-14 days time horizon
- Duration: in hours, from < 0.25 h to 24 h (or 'unknown')
- Target Area: 2D ellipse, with semi-axis ranging from 200 m to 2500 km
- Instructions: Generic instructions to population, taken from a library. *(combination of two instructions possible, to enrich the message)*
- Additional information for message customization *(magnitude of event, secondary ellipse for indicating safe destination, location of hazard, etc)*

Standard message

- Format jointly established with Japan Cabinet Office in 2022, allowing service interoperability between satellite systems Galileo and QZSS
- Several "GNSS" nations interested to adopt and implement it in their space systems

FORMAT OF THE ALERT MESSAGE (2)

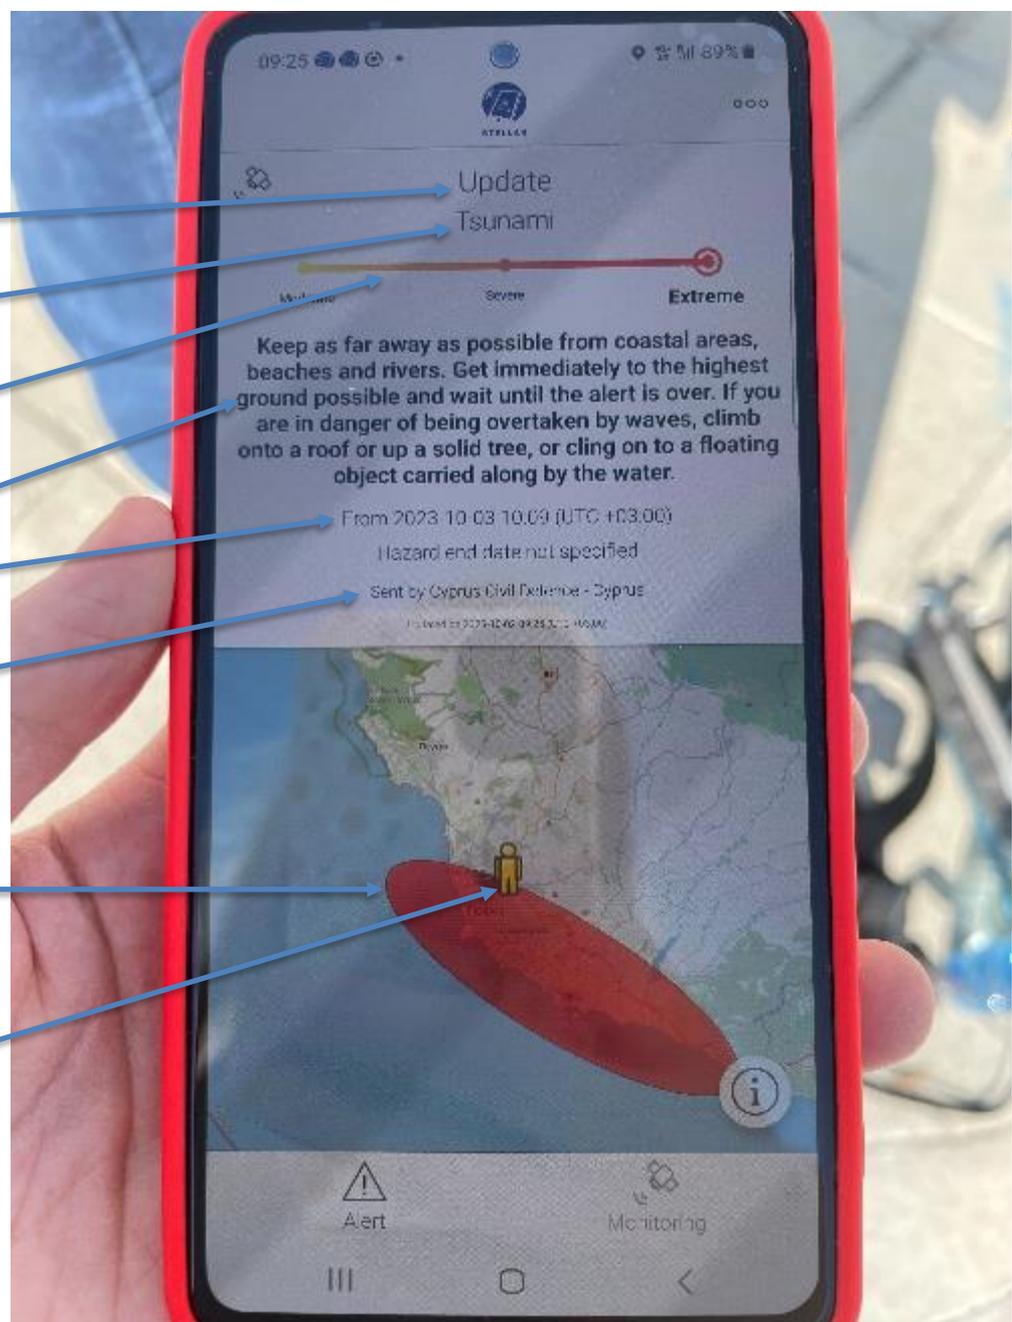

***Message format full
description soon to be
published !***

*Joint effort EU-Japan
(Galileo-QZSS)*

EXAMPLE

- Type of alert
- Type of hazard
- Severity of hazard
- Instruction
- Chronology of hazard
- Originator of alert
- Alert area (ellipse)
- YOUR POSITION**

- **Introduction of the capacity in the Galileo system**
 - On-going engineering activity to adjust the system and allow encapsulation of alert content in Galileo signal
 - Connections of MS civil protection agencies to the system: 2024
 - Service declaration: 2025
- **Bilateral and Multi-lateral contacts with civil protection stakeholders**
 - EU Member States
 - European Union’s Civil Protection and Humanitarian Aid Operations (DG ECHO)
 - Japan (Cabinet Office, AIT)
 - United Nations (UNESCO, EWS4ALL, ICG)
 - Interested nations
- **Publication of documentation**
 - Message format (2023)
 - Receiver guidelines, service definition document, Signal ICD (2024)

STATE OF PLAY – DEMONSTRATIONS

- **Field demonstrations in 2023**

- France (June '23), Germany (June '23), Cyprus (Oct '23)
- Last demonstration scheduled January '24, in Belgium / Luxembourg 

- **Purpose: organize end-to-end, in-field demonstrations of alert dissemination using the real Galileo system, and featuring:**

- An HMI to experience the coding of the alert (*crisis room perspective*),
- User experiences the reception and notification of an alert on smartphone (*end user perspective*),
- Monitoring capacity to measure and report the performance of the service (*service provider perspective*).

- **Objective: show-case the potential of alert dissemination via satellite**

- Civil protection authorities are invited to participate and experience live the characteristics and performance of the service, and provide feedback on performance, interface design and functionalities, and coherence with national doctrine, systems and protocols.

- **Workshop with participants and observers in February 2024**

version 3.3.4

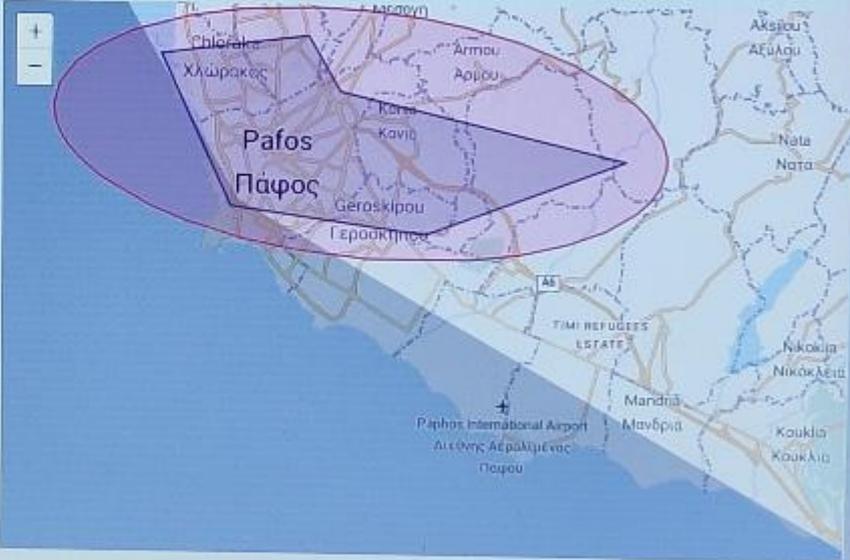

Ellipse of the alerted area

The ellipse is automatically calculated according to the constraints related to the sending of messages by satellites.

Please note that your alert area crosses your national border, however people on the other side of the border won't be notified.

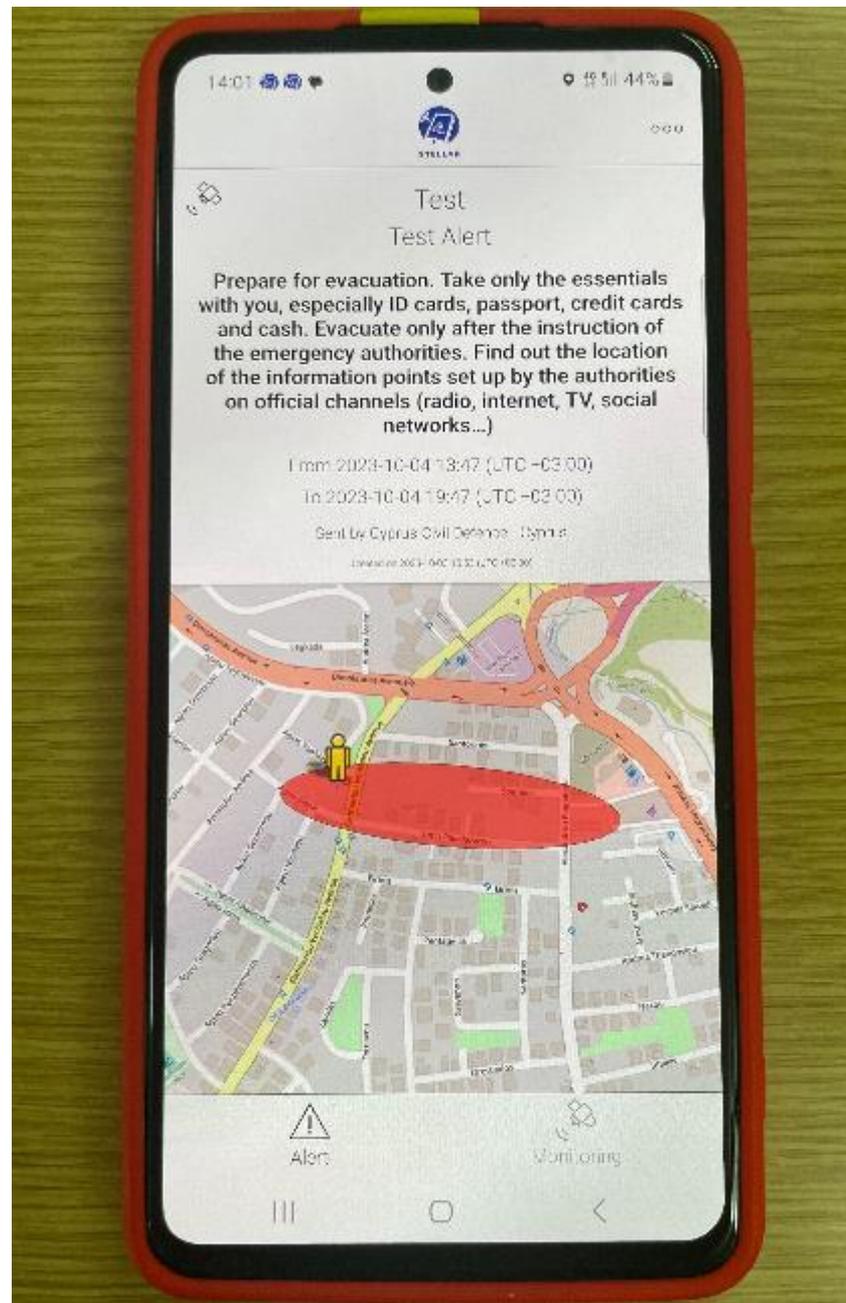

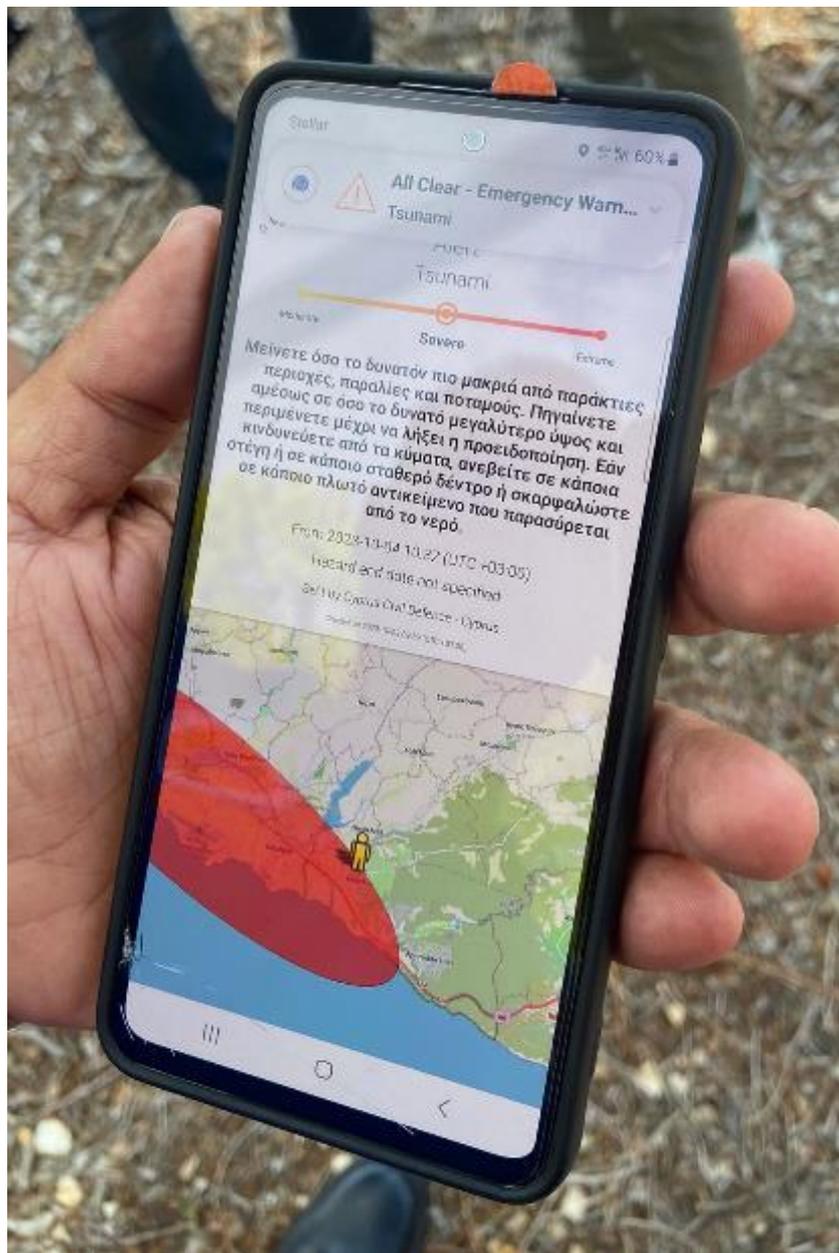

Reset all areas

Validate the alert area

The map shows the Pafos region in Cyprus. A purple ellipse highlights the alerted area, which includes the city of Pafos (Πάφος) and extends across the national border into Greece. Labels on the map include: Χλωράκι, Χλωράκης, Αρμού, Αρμού, Κάρια, Κανία, Γεροκίριου, Γεροκίτης, Pafos Παφος, Ράφος International Airport, Διεθνές Αεροδρόμιο Πάφου, Mandria Μανδριά, Νικόκλια, Νικόκλια, and Κουκλία, Κουκλία. A 'TIMI REFUGEES LGSTATE' label is also visible near the border.
